

Storex Build Request Log

A chronological record of the commands and product requests issued in this Codex thread to build the small-shop store management app.

Total recorded requests: 47

1	Create a store management app for small shops to manage their inventory and also make sales. The app should use UUIDs. Potential store owners should be able to create a shop on the platform with shop name, optional logo, optional description that respects new lines, optional banner image, location, contacts, email, users, and products. App admins should approve stores and products. Shop management and app management should happen in Laravel Backpack admin. App admins should see everything for moderation but should not edit/delete shops and products; they can freeze, approve, or reject shops and products. Every shop should have a unique storefront slug. Shops should set up Paystack credentials. Enable bulk activities for app admins. Allow shop owners to duplicate products and set up bulk products.
2	Continue if you did not finish. Allow shop users to add other incomes and expenses for taxation purposes. Expenses should have a receipt file/image field. Enable login with both phone number and 6-digit PIN, or email address and password. Also enable Google login.
3	How do app admins login?
4	For app admins, they should not be able to see sales, income and expenses, finance and tax records. They can only see registered shops, their users, and their inventory for moderation.
5	Admin overview page should have cards for number of shops, shops pending approval, users, products, and products pending approval. Put inventory under shops. Once the admin opens a shop, they should see users and products. On the overview page, show all shops that need attention: pending or have pending products.
6	Give the overview cards different colors.
7	On pages where sections are placed in cards, like the shop details page, add clear margins that separate each card from the other.
8	On shop details, remove the All shops and Approvals & moderation buttons. Instead add a button to approve the shop and a button to approve all products in the inventory moderation section. Rename Inventory to Products on all pages.
9	Storefront should be a clickable link to the store instead of just the slug.
10	On the login page, use tabs to switch between login with email/password and login with phone/PIN instead of showing both forms at the same time.
11	On the shop detail page, show labels followed by their values: logo label then logo, banner label then banner, description label then actual description, etc.

12	Add product categories model and brands model.
13	When the storefront link is clicked, whether the shop is approved or not, app admins should be taken to a nice webpage showing all shop details with logo at the top, contact links and products at the top, logo in the left corner, and a nicely designed shop page.
14	Have buttons for freeze and reject on the storefront page. Remove the workspace button on the shops listing page since it is the same as preview.
15	Enable adding brands and categories on the fly if they are not already added.
16	There is currently no way for shop owners to add users to their shops.
17	There is also no place to put their Paystack credentials: public key and secret key.
18	Continue from where you stopped. Have dedicated pages for shop owners for payment credentials, users, and till / point of sale. Move bulk upload of products to the products page. Remove point of sale from shop preview page. Shop preview page should show sales stats, number of products, and other relevant stats. Also show all shop details like app admins can see, with a link to the storefront whether the shop is approved or not.
19	Sales to date should just be sales for today. Remove Recent sales & payments from the shop preview page.
20	Make customer email optional and phone number required. Ask whether it is possible to send the customer their receipt via WhatsApp.
21	Use manual WhatsApp sending. Generate a PDF receipt and send it via WhatsApp.
22	Add a download button for a sample CSV file.
23	Complete it.
24	Allow shops to scan barcodes from their device when adding/editing products and when using the POS.
25	Once a shop is approved, all its products should be auto-approved and all its uploads should be approved as well. Remove product approval.
26	Allow shop owners to make products either public or private/draft, using common industry language.
27	Remove shop details from the shop preview page and add an edit button on the preview page.
28	Add a sale price field. Add a section to create a storewide discount on all products, or on certain categories, brands, or the checkout price.

29	Remove shop name from the storefront header. Do not put the logo in a box. Set height only and let width conform so wide logos do not look weird.
30	Modify the POS so each product has an Add to cart button, and a section on the right shows products added to the cart with quantity adjustments and total price, like a WordPress e-commerce website.
31	Maintain the tabular representation of the products in the POS.
32	Finish it.
33	Add enable_inventory_management on shop. It forces owners to add quantity and cost prices for all products, disables editing the quantity field, enables returns, stock-ins, and stock-adjustment pages, adds reorder level default 10, and adds stock details with current quantity and movement history. Add inventory_movements with shop_id, product_id, type, quantity, reference_type, reference_id, reason, user_id, created_at. Product creation quantity is opening stock. Add prominent Receive Stock button. Add stock adjustment, low stock list, reorder list, inventory valuation, POS sale movements, and reversal on cancelled/refunded sales.
34	Have a page specifically for inventory management.
35	What other useful features am I missing?
36	Apply all these but maintain current roles.
37	On the storefront, let users see an Add to cart button. Add a cart icon at the top that shows cart items on hover and goes to a cart page on click. Cart page should allow quantity adjustments, then a standard checkout page, built with WooCommerce or Shopify in mind. If Paystack is not set up, allow pay with cash or pay with momo. Allow shop owners to set up their mobile money number and associated name.
38	Fix parse error: unexpected token -> in /app/vendor/phpunit/phpunit/src/Runner/Version.php on line 48 during composer post-update-cmd.
39	Use JavaScript to add items to cart so the page does not need to refresh.
40	Move the Place order button under the order summary.
41	How do I approve a manual sale?
42	Move manual sale approval to Sales. Have a marker near Sales showing how many are pending. Have a card for it where the stats show.
43	Use a length 7 alphanumeric code for reference in the momo reserved-order message instead of the UUID.

44	Make product name in the till cart slightly bigger and add plus and minus buttons beside the input so cashiers can quickly adjust product quantity.
45	Sales receipt page should have a button to download the receipt and another button to share the receipt with the client on WhatsApp. Send a PDF receipt via WhatsApp.
46	The Back to shop button should actually be Back to till.
47	Make product name in the till cart slightly bigger. It is too tiny.
